

$$w_{ij} = \begin{cases} 0 & \text{if } i = j, \\ \text{the weight of directed edge } (i, j) & \text{if } i \neq j \text{ and } (i, j) \in E \\ \infty & \text{if } i \neq j \text{ and } (i, j) \notin E \end{cases}$$

$$d_{ij}^{(k)} = \begin{cases} w_{ij} & \text{if } k = 0 \\ \min(d_{ij}^{(k-1)}, d_{ik}^{(k-1)} + d_{kj}^{(k-1)}) & \text{if } k \geq 1 \end{cases}$$

→ Recursive solution to all pairs shortest path problem.
 $d_{ij}^{(k)}$ → weight of a shortest path from vertex i to j for which all intermediate vertices are in the set $\{1, 2, \dots, k\}$
 If $k=0$, then a path from vertex i to j has no intermediate vertices. That means this path is having atmost one edge.
 So, $d_{ij}^{(0)} = w_{ij}$
